

Automotive door control system design

Prepared by: Tarek Wael

[I]Static Design Analysis:

ECU 1

Layered Architecture

APIs

GPIO Module:

<i>API</i>	<i>void GPIO_Init(void)</i>		
<i>Description</i>	Initializes the GPIO.		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	None

<i>API</i>	<i>void GPIO_write(uint8 portID, uint8 pinID, uint8 Value)</i>		
<i>Description</i>	Outputs a value on a pin		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	Port ID, Pin ID, Output value	<i>Return</i>	None

- *PortID* : uint8 variable, determines which port to interface with ranging from 0->4
- *PinID*: uint8 variable, determines which pin to interface with ranging from 0->16
- *Value*: uint8 variable, determines the value of the pin either 1 or 0

<i>API</i>	<i>uint8 GPIO_read(uint8 portID, uint8 pinID)</i>		
<i>Description</i>	Reads the value from a pin		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	Port ID, Pin ID	<i>Return</i>	Current value of the pin

- *PortID* : uint8 variable, determines which port to interface with ranging from 0->4
- *PinID*: uint8 variable, determines which pin to interface with ranging from 0->16

ADC Module:

<i>API</i>	<i>void ADC_Init(void)</i>		
<i>Description</i>	Initializes the ADC.		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	None

<i>API</i>	<i>uint32 ADC_readChannel(uint8 channelID)</i>		
<i>Description</i>	Reads the analog value		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	Channel ID	<i>Return</i>	Analog Value

- *channelID*: uint8 variable, determines which ADC channel to take conversion from, it ranges from 0->12

CAN Module:

<i>API</i>	<i>void CAN_Init(void)</i>		
<i>Description</i>	Initializes CAN.		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	None

<i>API</i>	<i>void CAN_voidStart(void)</i>		
<i>Description</i>	Starts CAN protocol		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	None

<i>API</i>	<i>void CAN_AddTxMsg(CAN_TxHeaderTypeDef *pTxHeader, uint8 Local_u8Data [])</i>		
<i>Description</i>	Send message through CAN		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	PTxHeader , Data array	<i>Return</i>	None

- *pTxHeader* : a pointer to the head of the transmitted buffer.

- *Local_u8Data []*: An array of type uint8 that holds the data needed to be transmitted

Speed Sensor Module:

<i>API</i>	<i>Uint32 SpeedSensorGetSpeed(void)</i>		
<i>Description</i>	Returns vehicle speed		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	Speed value

Door Sensor Module:

<i>API</i>	<i>Uint8 DoorGetStatus(void)</i>		
<i>Description</i>	Returns door status		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	Door Status

Light Switch Module:

<i>API</i>	<i>Uint8 LSwitchGetStatus(void)</i>		
<i>Description</i>	Returns light switch status		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	Switch Status

Data Logger Module:

<i>API</i>	<i>void DataLoggerSave(uint32 data)</i>		
<i>Description</i>	Save the data sent to it.		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	Data	<i>Return</i>	None

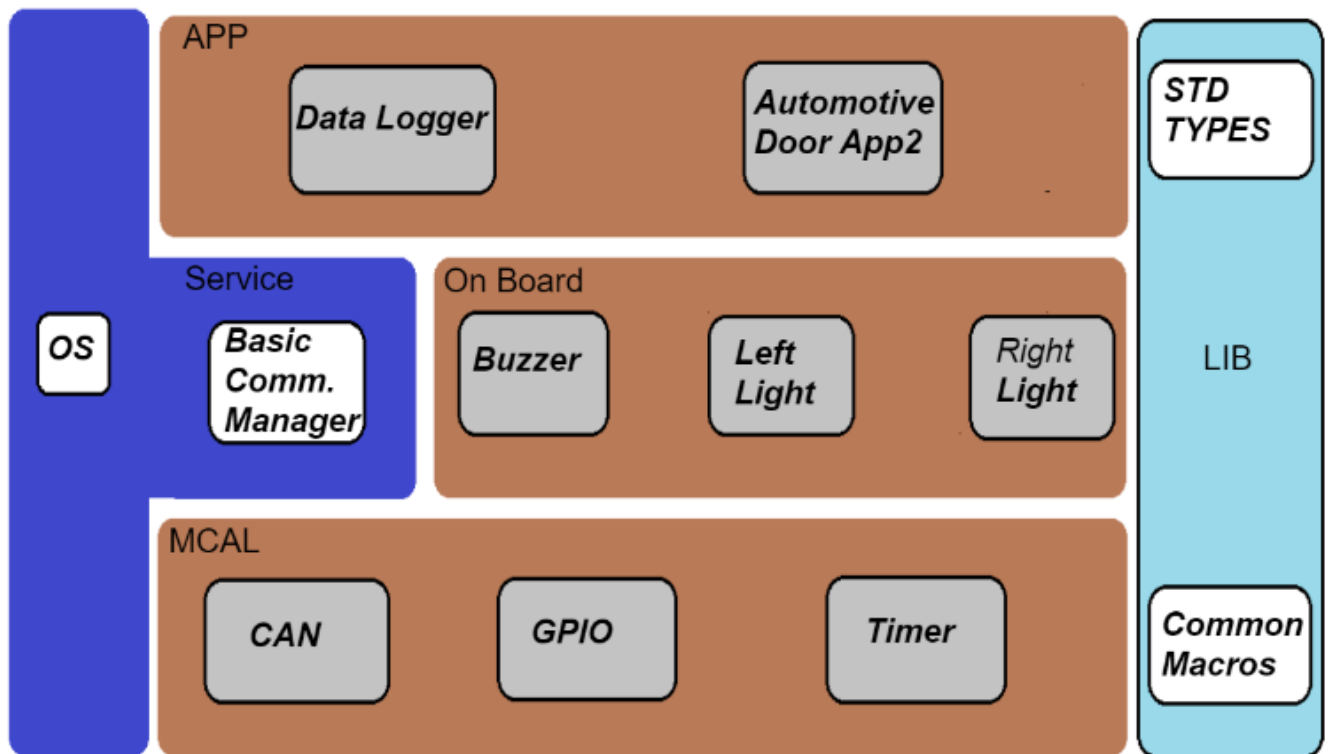

App Module:

<i>API</i>	<i>void SendVehicleSpeed_Task(void)</i>		
<i>Description</i>	Sends vehicle's filtered speed read from speed sensor to ECU2 via CAN bus		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	None

<i>API</i>	<i>void SendDoorState_Task(void)</i>		
<i>Description</i>	Sends doors' state read from door sensors to ECU2 via CAN bus		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	None

<i>API</i>	<i>void SendSwitchState_Task(void)</i>		
<i>Description</i>	Sends light switch state to ECU2 via CAN bus		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	None

Layered Architecture

APIs

GPIO Module:

<i>API</i>	<i>void GPIO_Init(void)</i>		
<i>Description</i>	Initializes the GPIO.		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	None

<i>API</i>	<i>void GPIO_write(uint8 portID, uint8 pinID, uint8 Value)</i>		
<i>Description</i>	Outputs a value on a pin		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	Port ID, Pin ID, Output value	<i>Return</i>	<i>None</i>

- *PortID* : uint8 variable, determines which port to interface with ranging from 0->4
- *PinID*: uint8 variable, determines which pin to interface with ranging from 0->16
- *Value*: uint8 variable, determines the value of the pin either 1 or 0

<i>API</i>	<i>uint8 GPIO_read(uint8 portID, uint8 pinID)</i>		
<i>Description</i>	Reads the value from a pin		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	Port ID, Pin ID	<i>Return</i>	Current value of the pin

- *PortID* : uint8 variable, determines which port to interface with ranging from 0->4
- *PinID*: uint8 variable, determines which pin to interface with ranging from 0->16

CAN Module:

<i>API</i>	<i>void CAN_Init(void)</i>		
<i>Description</i>	Initializes CAN.		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	None

<i>API</i>	<i>void CAN_voidStart(void)</i>		
<i>Description</i>	Starts CAN protocol		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	None

<i>API</i>	<i>void CAN_voidGetRxMsg(CAN_RxHeaderTypeDef *pRxHeader, uint8 Local_u8Data[])</i>		
<i>Description</i>	Receive message through CAN		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	Rx Buffer, PTxHeader , Data array	<i>Return</i>	None

- *pRxHeader* : a pointer to the head of the transmitted buffer.
- *Local_u8Data []*: An array of type uint8 that holds the data received.

Timer Module:

<i>API</i>	<i>void TIM_Init(uint8 TimNum)</i>		
<i>Description</i>	Initialize the Timer.		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	Tim_x	<i>Return</i>	None

- *TimNum* : uint8 variable that determines which timer to enable, it ranges from 0->6

<i>API</i>	<i>void TIM_SetInterval(uint32 time_ms, void (*Copy_ptr)(void))</i>		
<i>Description</i>	Reads the analog value.		
<i>Sync/Async</i>	Asynchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	Time in ms , pointer to callback function	<i>Return</i>	None

- *Time_ms* : uint32 variable which is considered the time to count in milliseconds.
- *Copy_ptr*: A pointer to function which is the notification function that performs an action when the ISR triggers.

<i>API</i>	<i>uint32 TIM_GetElapsedTime(void)</i>		
<i>Description</i>	Get elapsed time.		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	Elapsed time

Buzzer Module:

<i>API</i>	<i>void BuzzerON(void)</i>		
<i>Description</i>	Activates buzzer		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	None

<i>API</i>	<i>void BuzzerOFF(void)</i>		
<i>Description</i>	Deactivates buzzer		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	None

Lights Module:

<i>API</i>	<i>void LightsON(void)</i>		
<i>Description</i>	Switch on lights		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	None

<i>API</i>	<i>void LightsOFF(void)</i>		
<i>Description</i>	Switch off lights		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	None

Data Logger Module:

<i>API</i>	<i>void DataLoggerSave(uint32 data)</i>		
<i>Description</i>	Save the data sent to it.		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	Data	<i>Return</i>	None

App Module:

<i>API</i>	<i>void Action_Task(void)</i>		
<i>Description</i>	Make an action according to the 3 input sensors' readings		
<i>Sync/Async</i>	Synchronous	<i>Reentrancy</i>	Non reentrant
<i>Parameters</i>	None	<i>Return</i>	None
